

Today I am going to show how to send SMS using Grameenphone's API.

What I Used to built my application:

1. JAVA
2. NetBeans IDE 6.7

At first go to www.aloashbei.com and register there. This registration is required because it gives you a **username** & **password** in respect to your **mobile no**. This username & password is used in our application.

Let's start. Open NetBeans IDE. Create an empty **Java Application Project**. Now we need to add a **Web Service Client** in our project.

Be sure our working project is set as **Main Project**. To do so right click on the Project Name in the Project Browser's window and Select **Set as Main Project**.

Now go to **File Menu > New File** a window opens.....

For

Categories select > **Web Services**

File Types select > **Web Service Client**

Click **Next > WSDL and Client Window** Appears.....

Select **WSDL URL** and paste there:

https://www.aloashbei.com.bd/API/GP.ADP.BizTalk.SMS.Orchestrations/WebService_GP_ADP_BizTalk_SMS_Orchestrations.asmx?wsdl

Rest Will be same. Click **Finish**.

Now you need to import some packages from that web service to use in your application. Here is my completed code for **NewClass.java** :-

```
import com.grameenphone.playground.*;
import com.grameenphone.*;
import
com.grameenphone.sendsmsrequest_xml.SendSMSReques
t;
```

```
public class NewClass{
```

```
    public static void main(String[] args) {
        String regID = "yourUsername"; //put your aloashbei.com
        username here
        String passWord = "yourPassword"; // put your
        aloashbei.com password here
        String fromMSISDN = "8801746743391"; //put your GP
        mobile no. here
        String toMSISDN = "8801746743391"; //put recipient's GP
        mobile no. here
        String smsPort = "5001"; //default port No.
        double charge = 0.00; //this is why the SMS is free now
```

```
        int msgType = 4; //4 is used for text sending; there are
        some others
        String contentArea = "test";
        String msgContent = "hi, this is my first software using gp
        API, i can send sms free..:~)";
```

```
        try {
            WebServiceGPADPBizTalkSMSOrchestrations service =
            new WebServiceGPADPBizTalkSMSOrchestrations();
            WebServiceGPADPBizTalkSMSOrchestrationsSoap port =
            service.getWebServiceGPADPBizTalkSMSOrchestrationsS
            oap();
```

```
            SendSMSRequest messageRequest = new
            SendSMSRequest();
```

```
            messageRequest.setRegistrationID(regID);
            messageRequest.setPassword(passWord);
```

```
messageRequest.setSourceMsisdn(fromMSISDN);
messageRequest.setDestinationMsisdn(toMSISDN);
messageRequest.setSmsPort(smsPort);
messageRequest.setMsgType(msgType);
messageRequest.setCharge(charge);
```

```
messageRequest.setChargedParty(fromMSISDN);
messageRequest.setContentArea(contentArea);
messageRequest.setMsgContent(msgContent);
```

```
sendsmsresponse_xml.schemas.biztalk.adp.gp.SendSMSRe
sponse result = port.sendSMS(messageRequest);
```

```
System.out.println("Result = " + result.getStatus() + " " +
result.getMsgID()); //It shows message sending result...
} catch (Exception ex) {
ex.printStackTrace();
}
}
}
```

Now one important thing to do is changes in two files:

1. Double Click on the marked two files: 
2. Replace
http://192.168.100.169/API/GP.ADP.BizTalk.SMS.Orchestrations/WebService_GP_ADP_BizTalk_SMS_Orchestrations.asmx by
https://www.aloashbei.com.bd/API/GP.ADP.BizTalk.SMS.Orchestrations/WebService_GP_ADP_BizTalk_SMS_Orchestrations.asmx in both of the files
3. Now **Clean & Build** and **Run NewClass.java** to send SMS to a specific GP No. Be careful, in your every successful run it will send a SMS K. For test purpose you can use your mobile no. in both sender and receiver's mobile # field. There is a limitation in SMS sending/day. Probably it is 50 SMS/day. Hope it runs successfully. Cheers!
